# PROPERTIES OF EXTREMAL SEQUENCES FOR THE BELLMAN FUNCTION OF THE DYADIC MAXIMAL OPERATOR 

ELEFTHERIOS N. NIKOLIDAKIS

#### Abstract

We prove a necessary condition that has every extremal sequence for the Bellman function of the dyadic maximal operator. This implies the weak- $L^{p}$ uniqueness for such a sequence.

## 1. Introduction

The dyadic maximal operator on $\mathbb{R}^{k}$ is defined by

$$
\begin{equation*}
\mathcal{M}_{d} \phi(x)=\sup \left\{\frac{1}{|Q|} \int_{Q}|\phi(u)| d u: x \in Q, Q \subseteq \mathbb{R}^{k} \text { is a dyadic cube }\right\} \tag{1.1}
\end{equation*}
$$

for every $\phi \in L_{\text {loc }}^{1}\left(\mathbb{R}^{k}\right)$, where $|\cdot|$ is the Lebesgue measure on $\mathbb{R}^{k}$ and the dyadic cubes are those formed by the grids $2^{-N} \mathbb{Z}^{k}, N=0,1,2, \ldots$.

It is well known that it satisfies the following weak type $(1,1)$ inequality:

$$
\begin{equation*}
\left|\left\{x \in \mathbb{R}^{k}: \mathcal{M}_{d} \phi(x) \geq \lambda\right\}\right| \leq \frac{1}{\lambda} \int_{\left\{\mathcal{M}_{d} \phi \geq \lambda\right\}}|\phi(u)| d u \tag{1.2}
\end{equation*}
$$

for every $\phi \in L^{1}\left(\mathbb{R}^{k}\right)$ and $\lambda>0$.
From (1.2) it is easy to prove the following $L^{p}$-inequality

$$
\begin{equation*}
\left\|\mathcal{M}_{d} \phi\right\|_{p} \leq \frac{p}{p-1}\|\phi\|_{p} \tag{1.3}
\end{equation*}
$$

It is easy to see that (1.2) is best possible, while (1.3) is sharp as it can be seen in [W]. (See also [B1] and [B2] for general martingales).

A way of studying the dyadic maximal operator is to find certain refinements of the above inequalities.Concerning (1.2) refinements have been studied in [MN2], [N1] and [N2], while for (1.3) the Bellman function of two variables for $p>1$, has been introduced by the following way:

$$
\begin{array}{r}
T_{p}(f, F)=\sup \left\{\frac{1}{|Q|} \int_{Q}\left(\mathcal{M}_{d} \phi\right)^{p}: \phi \geq 0,\right. \\
\frac{1}{|Q|} \int_{Q} \phi(u) d u=f  \tag{1.4}\\
\left.\frac{1}{|Q|} \int_{Q} \phi^{p}(u) d u=F\right\}
\end{array}
$$

where $Q$ is a fixed dyadic cube on $\mathbb{R}^{k}$ and $0<f^{p} \leq F$.

[^0]The function given in (1.4) has been explicitely computed. Actually, this is done in a much more general setting of a non-atomic probability measure space $(X, \mu)$ where the dyadic sets are now given in a family of sets $\mathcal{T}$, called tree, which satisfies conditions similar to those that are satisfied by the dyadic cubes on $[0,1]^{k}$.

Then the associated dyadic maximal operator $\mathcal{M}_{\mathcal{T}}$ is defined by

$$
\begin{equation*}
\mathcal{M}_{\mathcal{T}} \phi(x)=\sup \left\{\frac{1}{\mu(I)} \int_{I}|\phi| d \mu: x \in I \in \mathcal{T}\right\} \tag{1.5}
\end{equation*}
$$

where $\phi \in L^{1}(X, \mu)$.
Then the Bellman function (for a given $p>1$ ) of two variables associated to $\mathcal{M}_{\mathcal{T}}$ is given by

$$
\begin{equation*}
S_{p}(f, F)=\sup \left\{\int_{X}\left(\mathcal{M}_{\mathcal{T}} \phi\right)^{p} d \mu: \phi \geq 0, \int_{X} \phi d \mu=f, \int_{X} \phi^{p} d \mu=F\right\} \tag{1.6}
\end{equation*}
$$

where $0<f^{p} \leq F$.
In $[\mathrm{M}],(1.6)$ has been found to be $S_{p}(f, F)=F \omega_{p}\left(f^{p} / F\right)^{p}$ where $\omega_{p}$ : $[0,1] \rightarrow\left[1, \frac{p}{p-1}\right]$ is the inverse function $H_{p}^{-1}$ of $H_{p}$ defined on $\left[1, \frac{p}{p-1}\right]$ by $H_{p}(z)=-(p-1) z^{p}+p z^{p-1}$.

As a result the Bellman function is independent of the measure space $(X, \mu)$ and the underlying tree $\mathcal{T}$. Other approaches for the computation of (1.4) can be seen in [NM] and [SSV].

In this paper we study those sequences of functions: $\left(\phi_{n}\right)_{n}$, that are extremal for the Bellman function (1.6). That is $\phi_{n}:(X, \mu) \rightarrow \mathbb{R}^{+}$, $n=1,2, \ldots$ satisfy $\int_{X} \phi_{n} d \mu=f, \int_{X} \phi_{n}^{p} d \mu=F$ and

$$
\begin{equation*}
\lim _{n} \int_{X}\left(\mathcal{M}_{\mathcal{T}} \phi_{n}\right)^{p} d \mu=F \omega_{p}\left(f^{p} / F\right)^{p} \tag{1.7}
\end{equation*}
$$

In Section 3 we prove the following
Theorem 1.1. Let $\phi_{n}:(X, \mu) \rightarrow \mathbb{R}^{+}$be as above. Then for every $I \in \mathcal{T}$,

$$
\begin{equation*}
\lim _{n} \frac{1}{\mu(I)} \int_{I} \phi_{n} d \mu=f \quad \text { and } \quad \lim _{n} \frac{1}{\mu(I)} \int_{I} \phi_{n}^{p} d \mu=F . \tag{1.8}
\end{equation*}
$$

Additionally:

$$
\lim _{n} \frac{1}{\mu(I)} \int_{I}\left(\mathcal{M}_{\mathcal{T}} \phi_{n}\right)^{p} d \mu=F \omega_{p}\left(f^{p} / F\right)^{p}
$$

for every $I \in \mathcal{T}$.
This gives as an immediate result that extremal functions do not exist for the Bellman function. Another corollary is the weak- $L^{p}$ uniqueness of such a sequence in all interesting cases. In other words if $\left(\phi_{n}\right)_{n},\left(\psi_{n}\right)_{n}$ are extremal sequences for (1.4), then $\lim _{n} \int_{Q}\left(\phi_{n}-\psi_{n}\right) h d \mu=0$, for every $h \in L^{p}(Q)$, where $\frac{1}{p}+\frac{1}{q}=1$. We need also to mention that related results in connection
with Kolmogorov's inequality have been treated in [MN1], while in [N3] it is given a characterization of such extremal sequences. More precisely it s proved there that they actually behave approximately like eigenfunctions of the dyadic maximal operator for a specific eigenvalue.

## 2. Extremal sequences

Let $(X, \mu)$ be a non-atomic probability measure space. We give the following

Definition 2.1. A set $\mathcal{T}$ of measurable subsets of $X$ will be called a tree if the following are satisfied:
i) $X \in \mathcal{T}$ and for every $I \in \mathcal{T}, \mu(I)>0$.
ii) For every $I \in \mathcal{T}$ there corresponds a finite or countable subset $C(I)$ of $\mathcal{T}$ containing at least two elements such that
(a) the elements of $C(I)$ are disjoint subsets of $I$
(b) $I=\cup C(I)$
iii) $\mathcal{T}=\bigcup_{m \geq 0} \mathcal{T}_{(m)}$, where $\mathcal{T}_{(0)}=\{X\}$ and

$$
\mathcal{T}_{(m+1)}=\bigcup_{I \in \mathcal{T}_{(m)}} C(I)
$$

iv) The following holds $\lim _{m \rightarrow \infty} \sup _{I \in \mathcal{T}_{(m)}} \mu(I)=0$.

Definition 2.2. Given a tree $\mathcal{T}$ we define the maximal operator associated to it as follows:

$$
\mathcal{M}_{\mathcal{T}} \phi(x)=\sup \left\{\frac{1}{\mu(I)} \int_{I}|\phi| d \mu: x \in I \in \mathcal{T}\right\}
$$

for every $\phi \in L^{1}(X, \mu)$.
From $[\mathrm{M}]$ we obtain the following:
Theorem 2.3. The following holds

$$
\sup \left\{\int_{X}\left(\mathcal{M}_{\mathcal{T}} \phi\right)^{p} d \mu: \phi \geq 0, \quad \int \phi d \mu=f, \int_{X} \phi^{p} d \mu=F\right\}=F \omega_{p}\left(f^{p} / F\right)^{p}
$$

for $0<f^{p} \leq F$.
At last we give the following
Definition 2.4. Let $\left(\phi_{n}\right)_{n}$ be a sequence of non-negative measurable functions defined on $X$ and $0<f^{p} \leq F, p>1$. $\left(\phi_{n}\right)_{n}$ is called $(p, f, F)$ extremal, or simply extremal if the following hold:

$$
\int_{X} \phi_{n} d \mu=f, \int_{X} \phi_{n}^{p} d \mu=F, \text { for every } n=1,2, \ldots
$$

$$
\lim _{n} \int_{X}\left(\mathcal{M}_{\mathcal{T}} \phi_{n}\right)^{p} d \mu=F \omega_{p}\left(f^{p} / F\right)^{p}
$$

## 3. Main theorem

Theorem 3.1. Let $\left(\phi_{n}\right)_{n}$ be an extremal sequence. Then for every $I \in \mathcal{T}$ the following hold:
i) $\lim _{n} \frac{1}{\mu(I)} \int_{I} \phi_{n} d \mu=f$
ii) $\lim _{n} \frac{1}{\mu(I)} \int_{I} \phi_{n}^{p} d \mu=F$
iii) $\lim \frac{1}{\mu(I)} \int_{I}\left(\mathcal{M}_{\mathcal{T}} \phi_{n}\right)^{p} d \mu=F \omega_{p}\left(f^{p} / F\right)^{p}$.

Proof. We remind that $\mathcal{T}_{(0)}=\{X\}$ and $\mathcal{T}=\bigcup_{m \geq 0} \mathcal{T}_{(m)}$. We prove this theorem for $I \in \mathcal{T}_{(1)}$. Then inductively it holds for every $I \in \mathcal{T}_{(m)}, m \geq 1$.

Suppose then that $\mathcal{T}_{(1)}=\left\{I_{k}, k=1,2, \ldots\right\}$ and $I=I_{1}$. We now set

$$
\begin{gather*}
f_{n, 1}=\frac{1}{\mu\left(I_{1}\right)} \int_{I_{1}} \phi_{n} d \mu, \quad f_{n, 2}=\frac{1}{\mu\left(X \backslash I_{1}\right)} \int_{X \backslash I_{1}} \phi_{n} d \mu, \\
F_{n, 1}=\frac{1}{\mu\left(I_{1}\right)} \int_{I_{1}} \phi_{n}^{p} d \mu, F_{n, 2}=\frac{1}{\mu\left(X \backslash I_{1}\right)} \int_{X \backslash I_{1}} \phi_{n}^{p} d \mu, \text { for } n=1,2, \ldots, \tag{3.1}
\end{gather*}
$$

The above sequences are obviously bounded, so passing to a subsequence we may suppose that

$$
\lim _{n} f_{n, i}=f_{i} \text { and } \lim _{n} F_{n, i}=F_{i}, \text { for } i=1,2
$$

For any $J \in \mathcal{T}$ define

$$
\mathcal{M}_{J} \phi(t)=\sup \left\{\frac{1}{\mu(K)} \int_{K}|\phi| d \mu: t \in K \in \mathcal{T}_{J}\right\}, \quad \text { for } t \in J
$$

where $\mathcal{T}_{J}$ is defined by

$$
\mathcal{T}_{J}=\{K \in \mathcal{T}: K \subseteq J\}
$$

Consider the measure space $\left(J, \frac{\mu(\cdot)}{\mu(J)}\right)$, the tree $\mathcal{T}_{J}$ and the associated maximal operator $\mathcal{M}_{J}$. Then using Theorem 2.3, we have that

$$
\begin{equation*}
\frac{1}{\mu(J)} \int_{J}\left(\mathcal{M}_{J} \phi\right)^{p} d \mu \leq \frac{1}{\mu(J)} \int_{J} \phi^{p} d \mu \cdot \omega_{p}\left(\frac{\left(\frac{1}{\mu(J)} \int_{J} \phi d \mu\right)^{p}}{\frac{1}{\mu(J)} \int_{J} \phi^{p} d \mu}\right)^{p} \tag{3.2}
\end{equation*}
$$

for every $\phi \in L^{p}(J)$, where $\omega_{p}:[0,1] \rightarrow\left[1, \frac{p}{p-1}\right]$ is $H_{p}^{-1}$, with

$$
H_{p}(z)=-(p-1) z^{p}+p z^{p-1}, \quad z \in\left[1, \frac{p}{p-1}\right]
$$

Since $H_{p}$ is decreasing we conclude from (3.2) that

$$
H_{p}\left(\left[\frac{\int_{J}\left(\mathcal{M}_{J} \phi\right)^{p}}{\int_{J} \phi^{p} d \mu}\right]^{1 / p}\right) \geq \frac{1}{\mu(J)^{p-1}} \frac{\left(\int_{J} \phi d \mu\right)^{p}}{\int_{J} \phi^{p} d \mu}
$$

which gives

$$
\begin{align*}
&-(p-1) \int_{J}\left(\mathcal{M}_{J} \phi\right)^{p} d \mu+p\left(\int_{J} \phi^{p} d \mu\right)^{1 / p} \cdot\left(\int_{J}\left(\mathcal{M}_{J} \phi\right)^{p} d \mu\right)^{1-\frac{1}{p}} \\
& \quad=\frac{1}{\mu(J)^{p-1}}\left(\int_{J} \phi d \mu\right)^{p}+\delta_{\phi, J} \tag{3.3}
\end{align*}
$$

for some $\delta_{\phi, J} \geq 0$ positive constant depending on $\phi$ and $J$.
For $\phi=\phi_{n}$ and $J=I_{i}, i=1,2, \ldots$ we obtain from (3.3)

$$
\begin{align*}
& -(p-1) \int_{I_{i}}\left(\mathcal{M}_{I_{i}} \phi_{n}\right)^{p} d \mu+p\left(\int_{I_{i}} \phi_{n}^{p} d \mu\right)^{1 / p} \cdot\left(\int_{I_{i}}\left(\mathcal{M}_{I_{i}} \phi_{n}\right)^{p} d \mu\right)^{1-\frac{1}{p}} \\
& \quad=\frac{1}{\mu\left(I_{i}\right)^{p-1}}\left(\int_{I_{i}} \phi_{n} d \mu\right)^{p}+\delta_{n, i}, \text { for every } n=1,2, \ldots \text { and } i=1,2, \ldots \tag{3.4}
\end{align*}
$$

Summing relations (3.4) for $i \geq 2$ we obtain

$$
\begin{align*}
- & (p-1) \sum_{i=2}^{+\infty} \int_{I_{i}}\left(\mathcal{M}_{I_{i}} \phi_{n}\right)^{p} d \mu+p \sum_{i=2}^{+\infty}\left(\int_{I_{i}} \phi_{n}^{p} d \mu\right)^{1 / p}\left(\int_{I_{i}}\left(\mathcal{M}_{I_{i}} \phi_{n}\right)^{p} d \mu\right)^{1-\frac{1}{p}} \\
& =\sum_{i=2}^{+\infty} \frac{1}{\mu\left(I_{i}\right)^{p-1}}\left(\int_{I_{i}} \phi_{n} d \mu\right)^{p}+\sum_{i=2}^{+\infty} \delta_{n, i} . \tag{3.5}
\end{align*}
$$

In view now of Holder's inequality in its primitive form:

$$
\sum_{i} a_{i} b_{i} \leq\left(\sum_{i} a_{i}^{p}\right)^{1 / p}\left(\sum_{i} b_{i}^{q}\right)^{1 / q}
$$

for $a_{i}, b_{i} \geq 0$ and $q=p /(p-1)$, (3.5) gives

$$
\begin{gather*}
-(p-1) A_{2}(n)+p\left(\int_{X \backslash I_{1}} \phi_{n}^{p} d \mu\right)^{1 / p} \cdot\left[A_{2}(n)\right]^{1-\frac{1}{p}} \\
\geq \sum_{i=2}^{+\infty} \frac{1}{\mu\left(I_{i}\right)^{p-1}}\left(\int_{I_{i}} \phi_{n} d \mu\right)^{p}+\sum_{i=2}^{+\infty} \delta_{n, i}, \text { where }  \tag{3.6}\\
A_{2}(n)=\sum_{i=2}^{+\infty} \int_{I_{i}}\left(\mathcal{M}_{I_{i}} \phi_{n}\right)^{p} d \mu \tag{3.7}
\end{gather*}
$$

(In the last inequality we used the fact that $X \backslash I_{1}=\bigcup_{i=2}^{+\infty} I_{i}$ ).
We use now Holder's inequality in the following form:

$$
\frac{\left(\lambda_{1}+\lambda_{2}+\cdots+\lambda_{m}\right)^{p}}{\left(\sigma_{1}+\sigma_{2}+\cdots+\sigma_{m}\right)^{p-1}} \leq \frac{\lambda_{1}^{p}}{\sigma_{1}^{p-1}}+\frac{\lambda_{2}^{p}}{\sigma_{2}^{p-1}}+\cdots+\frac{\lambda_{m}^{p}}{\sigma_{m}^{p-1}},
$$

where $\sigma_{i}, \forall i=1,2, \ldots$ and $\lambda_{i} \geq 0$, and obtain:

$$
\begin{equation*}
\sum_{i=2}^{+\infty} \frac{1}{\mu\left(I_{i}\right)^{p-1}}\left(\int_{I_{i}} \phi_{n} d \mu\right)^{p} \geq \frac{1}{\mu\left(X \backslash I_{1}\right)^{p-1}}\left(\int_{X \backslash I_{1}} \phi_{n} d \mu\right)^{p}=\mu\left(X \backslash I_{1}\right) f_{n, 2} \tag{3.8}
\end{equation*}
$$

We also set

$$
\begin{equation*}
A_{3}(n)=\int_{X \backslash I_{1}}\left(\mathcal{M}_{\mathcal{T}} \phi_{n}\right)^{p} d \mu, \text { for } n=1,2, \ldots \tag{3.9}
\end{equation*}
$$

Then by definition of $\mathcal{M}_{I_{i}}$ we have that

$$
\begin{equation*}
A_{3}(n) \geq A_{2}(n) \tag{3.10}
\end{equation*}
$$

From the above we then have that:

$$
\begin{equation*}
-(p-1) A_{2}(n)+p \mu\left(X \backslash I_{1}\right)^{1 / p}\left(F_{n, 2}\right)^{1 / p}\left[A_{3}(n)\right]^{1-\frac{1}{p}}=\mu\left(X \backslash I_{1}\right)\left(f_{n, 2}\right)^{p}+\delta_{n}^{(1)}, \tag{3.11}
\end{equation*}
$$

where $\delta_{n}^{(1)} \geq \sum_{i=2}^{+\infty} \delta_{n, i}$.
By passing to a subsequence we may suppose that $\lim _{n} A_{3}(n)=A_{3}$.
We will use now the following Lemma, the proof of which will be given at the end of this section.

Lemma 3.2. If $\left(\phi_{n}\right)_{n}$ is extremal then we have that

$$
\lim _{n} \mu\left(\left\{\mathcal{M}_{\mathcal{T}} \phi_{n}=f\right\}\right)=0
$$

From this Lemma and Definitions (3.7) and (3.9) we easily obtain that $\lim _{n} A_{2}(n)=\lim _{n} A_{3}(n)=A_{3}$, in view of the fact that $I_{i} \in \mathcal{T}_{(1)}$ for $i=$ $2,3, \ldots$.. Then from (3.11) we conclude that

$$
\begin{align*}
& -(p-1) \int_{X \backslash I_{1}}\left(\mathcal{M}_{\mathcal{T}} \phi_{n}\right)^{p} d \mu+p \mu\left(X \backslash I_{1}\right)^{1 / p}\left(F_{n, 2}\right)^{1 / p}\left(\int_{X \backslash I_{1}}\left(\mathcal{M}_{\mathcal{T}} \phi_{n}\right)^{p} d \mu\right)^{1-\frac{1}{p}} \\
& \quad=\mu\left(X \backslash I_{i}\right)\left(f_{n, 2}\right)^{p}+\delta_{n}^{\prime \prime} \tag{3.12}
\end{align*}
$$

where $\delta_{n}^{\prime \prime} \geq \delta_{n}^{\prime}$, for every $n \in N$.
In the same way we have that:

$$
\begin{aligned}
& -(p-1) \int_{I_{1}}\left(\mathcal{M}_{\mathcal{T}} \phi_{n}\right)^{p} d \mu+p \mu\left(I_{1}\right)^{1 / p}\left(F_{n, 1}\right)^{1 / p} \cdot\left(\int_{I_{1}}\left(\mathcal{M}_{\mathcal{T}} \phi_{n}\right)^{p} d \mu\right)^{1-\frac{1}{p}} \\
& =\mu\left(I_{1}\right)\left(f_{n, 1}\right)^{p}+\varepsilon_{n}^{\prime \prime}
\end{aligned}
$$

where $\varepsilon_{n}^{\prime \prime}$ is such that $\varepsilon_{n}^{\prime \prime} \geq \delta_{n, 1}$, for every $n \in N$.
Summing now (3.12) and (3.13) and using Holder's inequality in both previously mentioned forms we have that:

$$
\begin{align*}
& -(p-1) \int_{X}\left(\mathcal{M}_{\mathcal{T}} \phi_{n}\right)^{p} d \mu+p F^{1 / p}\left(\int_{X}\left(\mathcal{M}_{\mathcal{T}} \phi_{n}\right)^{p} d \mu\right)^{1-\frac{1}{p}} \\
& \quad \geq \mu\left(I_{1}\right)\left(f_{n, 1}\right)^{p}+\mu\left(X \backslash I_{1}\right)\left(f_{n, 2}\right)^{p}+\delta_{n}^{\prime \prime}+\varepsilon_{n}^{\prime \prime} \geq f^{p}+\delta_{n}^{\prime \prime}+\varepsilon_{n}^{\prime \prime} \tag{3.14}
\end{align*}
$$

which gives

$$
\begin{equation*}
-(p-1) \int_{X}\left(\mathcal{M}_{\mathcal{T}} \phi_{1}\right)^{p} d \mu+p F^{1 / p}\left(\int_{X}\left(\mathcal{M}_{\mathcal{T}} \phi_{n}\right)^{p} d \mu\right)^{1-\frac{1}{p}}=f^{p}+\vartheta_{n} \tag{3.15}
\end{equation*}
$$

where $\vartheta_{n} \geq \delta_{n}^{\prime \prime}+\varepsilon_{n}^{\prime \prime}, n=1,2, \ldots$.
The hypothesis now for $\left(\phi_{n}\right)$ is that

$$
\lim _{n} \int_{X}\left(\mathcal{M}_{\mathcal{T}} \phi_{n}\right)^{p} d \mu=F \omega_{p}\left(f^{p} / F\right)^{p}
$$

This gives $\vartheta_{n} \rightarrow 0$ in (3.15 and so

$$
\delta_{n}^{\prime \prime} \rightarrow 0, \varepsilon_{n}^{\prime \prime} \rightarrow 0
$$

As a consequence we have

$$
\mu\left(I_{1}\right)\left(f_{1}\right)^{p}+\mu\left(X \backslash I_{1}\right)\left(f_{2}\right)^{p}=f^{p}
$$

because of equality in (3.14), as $n \rightarrow+\infty$.
Since now $\mu\left(I_{1}\right) f_{1}+\mu\left(X \backslash I_{1}\right) f_{2}=f$ and $t \mapsto t^{p}$ is strictly convex on $(0,+\infty)$ we have that $f_{1}=f_{2}=f$.

Additionally $\delta_{n}^{\prime \prime} \rightarrow 0$, so because of (3.12) and the fact that $f_{2}=f$ we immediately see that

$$
\begin{equation*}
\lim _{n} \frac{1}{\mu\left(X \backslash I_{1}\right)} \int_{X \backslash I_{1}}\left(\mathcal{M}_{\mathcal{T}} \phi_{n}\right)^{p} d \mu=F_{2} \omega_{p}\left(f^{p} / F_{2}\right)^{p} . \tag{3.16}
\end{equation*}
$$

Similarly

$$
\begin{equation*}
\lim _{n} \frac{1}{\mu\left(I_{1}\right)} \int_{I_{1}}\left(\mathcal{M}_{\mathcal{T}} \phi_{n}\right)^{p} d \mu=F_{1} \omega_{p}\left(f^{p} / F_{1}\right)^{p} \tag{3.17}
\end{equation*}
$$

Since $\left(\phi_{n}\right)_{n}$ is extremal the last two equations give

$$
\begin{equation*}
\mu\left(I_{1}\right) \cdot F_{1} \omega_{p}\left(f^{p} / F_{1}\right)^{p}+\mu\left(X \backslash I_{1}\right) \cdot F_{2} \omega_{p}\left(f^{p} / F_{2}\right)^{p}=F \omega\left(f^{p} / F\right) \tag{3.18}
\end{equation*}
$$

But as we shall prove in Lemma 3.3 below the following function $t \mapsto$ $t \omega_{p}\left(f^{p} / t\right)^{p}, t \in\left(f^{p},+\infty\right)$ is strictly concave. So since $\mu\left(I_{1}\right) F_{1}+\mu\left(X \backslash I_{1}\right) F_{2}=F$ we have because of (3.18) that $F_{1}=F_{2}=F$. Then since (3.17) holds we conclude that

$$
\lim _{n} \frac{1}{\mu(I)} \int_{I}\left(\mathcal{M}_{\mathcal{T}} \phi_{n}\right)^{p} d \mu=F \omega_{p}\left(f^{p} / F\right)^{p}
$$

and Theorem 3.1 is now proved.
We prove now the following
Lemma 3.3. Let $G:(1,+\infty) \rightarrow \mathbb{R}^{+}$defined by $G(t)=t \omega_{p}(1 / t)^{p}$. Then $G$ is strictly concave.

Proof. It is known from $[\mathrm{M}]$ that $\omega_{p}$ satisfies

$$
\frac{d}{d x}\left[\omega_{p}(x)\right]^{p}=-\frac{1}{p-1} \frac{\omega_{p}(x)}{\omega_{p}(x)-1}, \quad x \in[0,1]
$$

So we can easily see that

$$
\begin{gathered}
G^{\prime}(t)=\omega_{p}(1 / t)^{p}+\frac{1}{p-1} \frac{1}{t} \frac{\omega_{p}(1 / t)}{\omega_{p}(1 / t)-1}, \text { and } \\
G^{\prime \prime}(t)=\frac{1}{p-1} \cdot \frac{1}{t}\left(\frac{g(t)}{g(t)-1}\right)^{\prime}
\end{gathered}
$$

where $g$ is defined on $(1,+\infty)$ by $g(t)=\omega_{p}(1 / t)$. Since $g^{\prime}(t)>0, \forall t>1$, we have that $G^{\prime \prime}(t)<0, \forall t>1$ and Lemma 3.3 is proved.

We continue now with
Proof of Lemma 3.1: Let us suppose first that $\phi_{n}$ are $\mathcal{T}$-simple functions that is for every $n$, there exists a $m_{n}$ such that $\phi_{n}$ is constant on each $I \in \mathcal{T}_{\left(m_{n}\right)}$. As a consequence $\phi_{n}$ is $\mathcal{T}$-good in the sense of $[\mathrm{M}]$, for every $n$. If we look at the proof of Lemma 9 in [M] p. 324-326 we see that in all inequalities (4.20), (4.22), (4.23), (4.24) we should have equality in the limit. So as a result we must have that $\frac{1}{\left(\beta+1-\beta \rho_{X}^{n}\right)^{p-1}}-\frac{(p-1) \beta \rho_{X}^{n}}{(\beta+1)^{p}} \rightarrow \frac{1}{(\beta+1)^{p-1}}$, for $\beta=\omega_{p}\left(f^{p} / F\right)-1$, where $\rho_{X}^{n}=\frac{a_{X}^{n}}{\mu(X)}=a_{X}^{n}$, where $a_{X}^{n}=\mu\left(\left\{\mathcal{M}_{\mathcal{T}} \phi_{n}=f\right\}\right)$. But this can happen only if $a_{X}^{n} \rightarrow 0$. So the proof is completed in the case of $\mathcal{T}$-simple functions. As for the general case, it is not difficult to see that if $\left(\phi_{n}\right)_{n}$ is an extremal sequence of measurable functions, then we can construct a sequence of $\mathcal{T}$-simple functions $\left(\psi_{n}\right)_{n}$ such that $\int_{X} \psi_{n} d \mu=f$, $\int_{X} \psi_{n}^{p} d \mu \leq F$ and

$$
\lim _{n} \int_{X} \psi_{n}^{p} d \mu=F, \quad \lim _{n} \int_{X}\left(\mathcal{M}_{\mathcal{T}} \psi_{n}\right)^{p} d \mu=F \omega_{p}\left(f^{p} / F\right)^{p}
$$

Additionally, we can arrange everything in such a way that $\left\{\mathcal{M}_{\mathcal{T}} \phi_{n}=f\right\} \subseteq$ $\left\{\mathcal{M}_{\mathcal{T}} \psi_{n}=f\right\}$.

Using the same arguments as before for $\left(\psi_{n}\right)_{n}$ we can prove that $\lim _{n} \mu\left(\left\{\mathcal{M}_{\mathcal{T}} \psi_{n}=f\right\}\right)=0$. So $\lim _{n} \mu\left(\left\{\mathcal{M}_{\mathcal{T}} \phi_{n}=f\right\}\right)=0$ and Lemma 3.2 is proved.

We now give some applications of the above.
First we prove the following
Corollary 3.4. If $0<f^{p}<F$ then there do not exist extremal functions for the Bellman function $T_{p}(f, F)$ described in (1.4).

Proof. Let $\phi$ be an extremal function for (1.4). Applying Theorem 3.1 we see that

$$
\frac{1}{\mu(I)} \int_{I} \phi d \mu=f \text { and } \frac{1}{\mu(I)} \int_{I} \phi^{p} d \mu=F,
$$

for every $I$ dyadic subcube of $Q$.
As we can see in [G] inequality (1.2) implies that the base of dyadic sets of the tree $\mathcal{T}$ differentiates $L^{1}(Q)$. That is

$$
\begin{aligned}
& \phi(x)=f \text { a.e } \text { and } \\
& \phi^{p}(x)=F \text { a.e. }
\end{aligned}
$$

This gives $f^{p}=F$, which is a contradiction.
We also prove
Corollary 3.5. Let $T_{p}(f, F)$ be described by (1.4). Then if $\left(\phi_{n}\right)_{n},\left(\psi_{n}\right)_{n}$ are extremal sequences for this function, we must have $\phi_{n}-\psi_{n} \xrightarrow{w\left(L^{p}\right)} 0$, as $n \rightarrow+\infty$.

Proof. Of course we have that

$$
\lim _{n} \frac{1}{|I|} \int_{I} \phi_{n}(u) d u=\lim _{n} \frac{1}{|I|} \int_{I} \psi_{n}(u) d u=f
$$

So $\lim _{n} \int_{Q}\left(\phi_{n}-\psi_{n}\right) \xi_{I}(u) d u=0$, f0r every dyadic subcube $I \subseteq Q$.
Since linear combinations of the characteristic functions of the dyadic subcubes of $Q$ are dense in $L^{q}(Q)$ we should have that $\lim _{n} \int_{Q}\left(\phi_{n}-\psi_{n}\right) h=0$, for every $h \in L^{q}(Q)$, where $q=\frac{p}{p-1}$ that is $\phi_{n}-\psi_{n} \xrightarrow{w\left(L^{p}\right)} 0$, as $n \rightarrow+\infty$.
